

INSTALLING TASTYIGNITER ON CLOUDWAYS HOSTING WITH JASON

or how to install TastyIgniter without using a command line

These instructions are meant to be a generalized yet instructive set of steps which can be followed. I want to show you not only how but why. Be aware though that there may be mistakes and oversites. I assume that if you are able to use a computer on a day to day basis at the level of a **User** then you will probably be able to follow this document. Please read the instruction booklet and count the nuts and bolts before you begin.

Please proceed with caution

Things may change and these instructions may become obsolete.

NOTE THE DATE THESE INSTRUCTIONS WERE PUBLISHED: **2023-04-04**

First we need to get the TastyIgniter program from the internet and put it onto your desktop computer. So click on this link or if you printed this document reopen it and then follow this link from your PDF file viewer. You might also copy this link and paste into the address bar of any web browser

<https://github.com/TastyIgniter/setup/archive/master.zip>

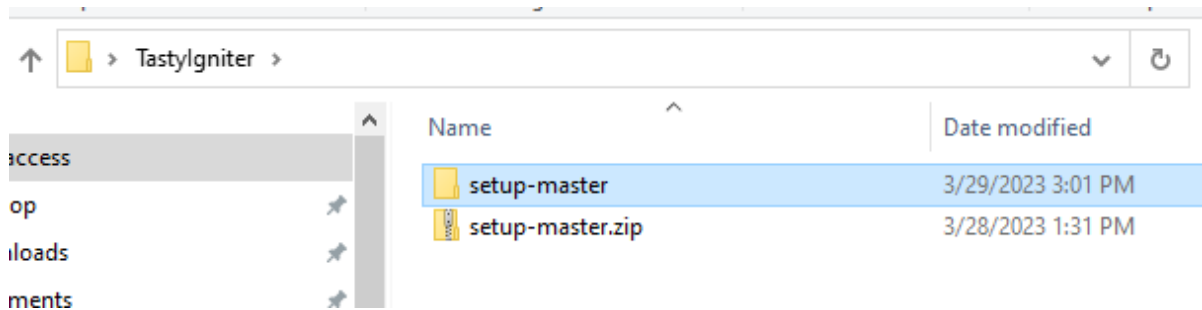

After it downloads then the .ZIP file containing the TastyIgniter program will be on your desktop computer. Create a new file folder called "TastyIgniter" on your desktop or someplace convenient for you.

Then find the .ZIP file containing the TastyIgniter program. It will be titled, "setup-master.zip". Place it into the file folder titled, "TastyIgniter".

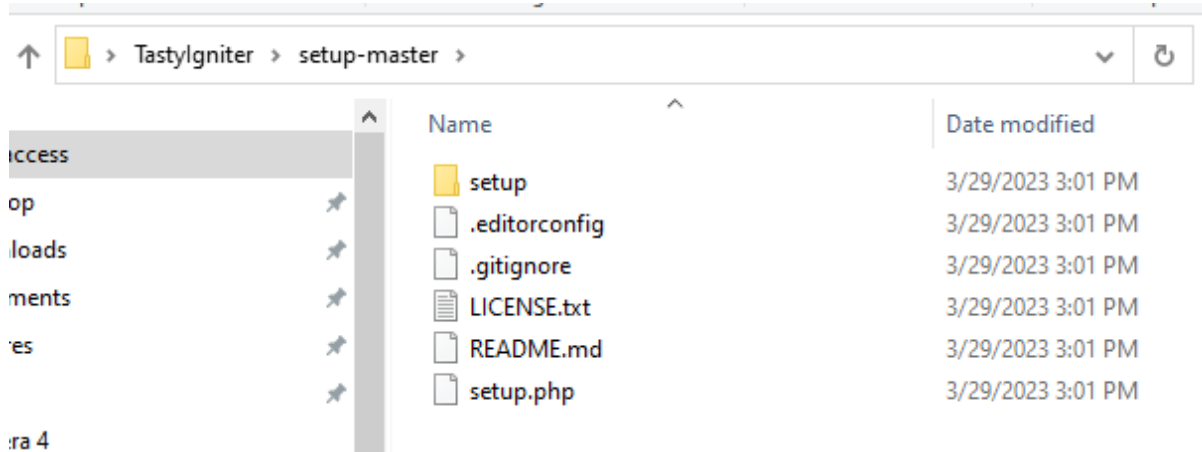

Then using the correct method for your operating system and any installed unzipping software unzip the .zip file into the file folder "TastyIgniter".

The file folders should be in this order.

Tastylgniter > setup-master >

I say this because sometimes people get confused as to where file folders and their content files need to be, especially when unzipping. They might be adding a file folder or omitting one or be putting the files in the wrong place. For this procedure it will make a difference because the files inside of the folder "setup-master" will need to be moved from your computer to the hosting computer into the correct place onto the hosting computer. Not doing so may result in some problems including not being able to find the installer on the hosting computer, or installing Tastylgniter into the wrong file folder on the hosting computer. Then you may get lost.

So you will need to upload about 60 files to your hosting computer to get this going. But it's not so easy to get 60 files from the Tastylgniter developers if you have to download them one by one. So instead what people do is to place those 60 files into a single ZIP file so that you only need to download just one file. But you need to then unzip it to get all 60 files onto your desktop computer. That is what we just did.

Now let's set that aside as we move over to the hosting computer part of it. I mentioned that we are going to do this without typing Linux commands into a command line, because some **Users** find that part to be tricky. Another problem is that what I call Commodity Hosting does not always set things up correctly for every purpose and every use. So, for example, if you try to set up on Hostgator you might encounter unexpected problems. Another thing is that some people have had difficulty getting Tastylgniter to work correctly by installing it from Softaculous. It may be available from inside of there but there might be some software components missing.

Three software components that Tastylgniter requires are as follows

Laravel
Composer
Artisan

These are programs that Tastylgniter is built upon. So not having them in place is a little like trying to build a house without a foundation.

I have found a hosting company called CloudWays which has already installed these three components

for you. That is the trick to getting TastyIgniter installed without touching a command line.

So Cloudways does provide a three day free trial. After that you have to give them your payment method or they will turn you off. You might be able to turn it back on if you give them your payment method. Also TastyIgniter should run on their cheapest plan which is \$10 a month. That will be fast enough for testing but if the volume of traffic increases you may want to pay more for more computer resources. If you do then you can just move the resource slider up without moving the program to a faster server. So it's not too bad.

SERVER SIZE

Please select your server size. You can always scale your server size whenever required.

Recommended: 4GB (or higher) for production website(s). 2 or 1GB is for Laravel staging or low traffic website(s).

They do bill month to month and bill at the end of the month so if you only go for half a month your bill will be \$5.

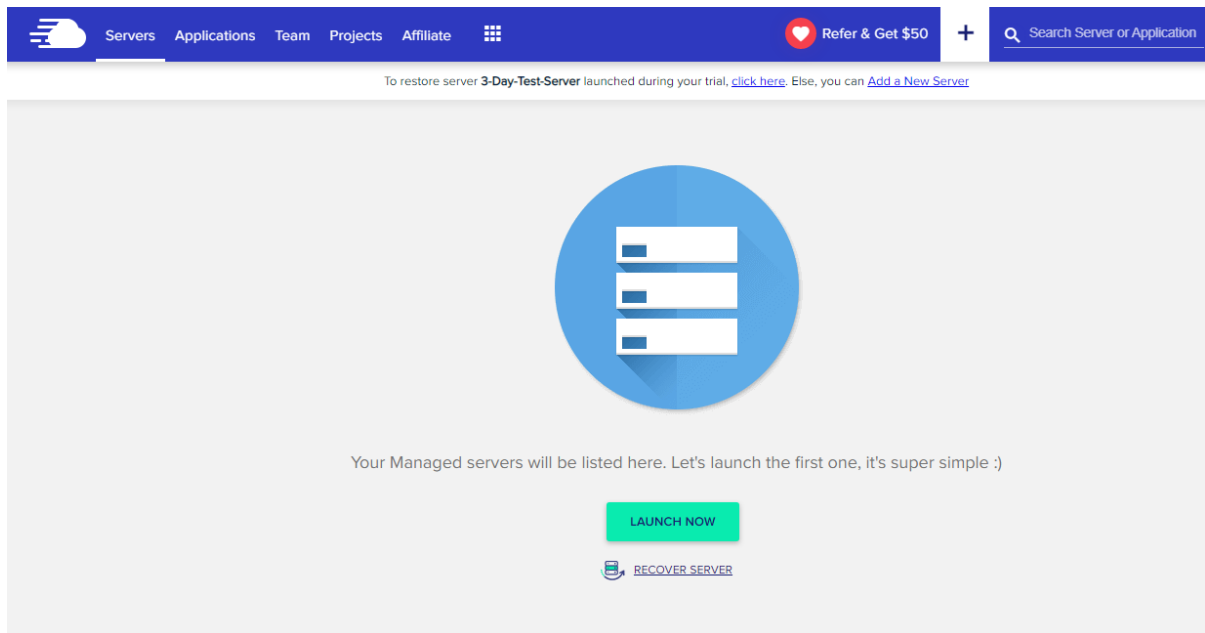

So then go to Cloudways website.

<https://cloudways.com>

And sign up.

You can use promocode 1WORLDMAX to save 10% off your first 3 months

Then proceed to the backend of your new hosting account.

Go to Servers which is the selection at the top left if it does not put you there already.

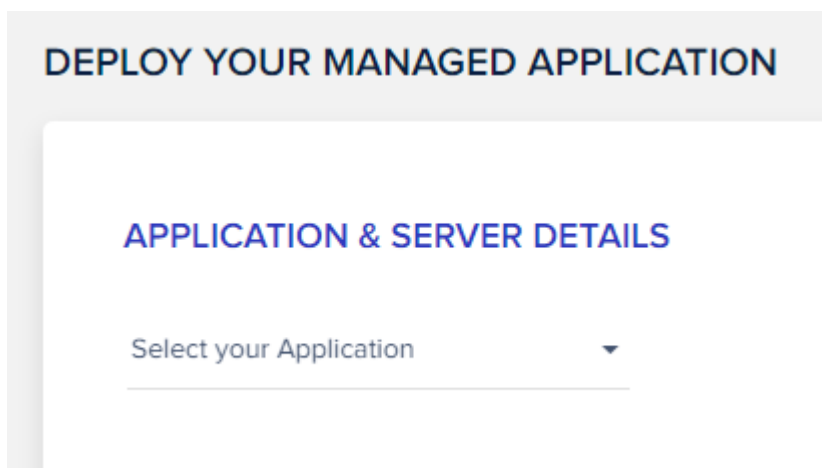

This kind of hosting is really different than what you may be used to with CPanel or something like it. But you may find that this is a good way to do things. I will try to walk you through part of what they can do here.

You don't get use of just part of one server such as with Bluehost for example (shared hosting), but can use several servers if you find the need. Yet the more servers you use the greater the cost. Let's start with the cheapest option which is just one server with only 1GB of RAM.

Click on the LAUNCH NOW button.

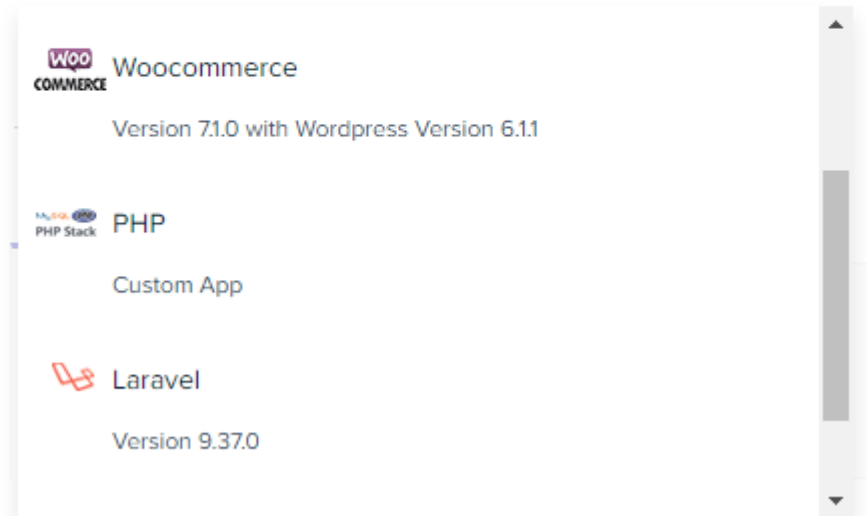

From the next screen it says, DEPLOY YOUR MANAGED APPLICATION.

From here scroll down untill you see Laravel, which is one of the three components I told you about before.

DEPLOY YOUR MANAGED APPLICATION

APPLICATION & SERVER DETAILS

Remember they already do some setting up stuff for you so pick Laravel. If you pick Woocommerce for example you won't get Laravel set up for you.

They organize things a certain way with their kind of hosting so we need to give them a server name, an app name, and a project name.

APPLICATION & SERVER DETAILS

Laravel	Name Your Managed App	Name Your Managed Server	Name your Project
 Version 9.37.0	TastyIgniter-App	TastyIgniter-Server	TastyIgniter-Project

Please fill them in. That will make the other stuff below light up.

SERVER SIZE

Please select your server size. You can always scale your server size whenever required.

DigitalOcean is the cheapest choice so pick that one.

Then slide the SERVER SIZE slider all of the way to the left.

SERVER SIZE

Please select your server size. You can always scale your server size whenever required.

Recommended: 4GB (or higher) for production website(s). 2 or 1GB is for Laravel staging or low traffic website(s).

It says, Recommended: 4GB (or higher) for production website(s). 2 or 1GB is for Laravel staging or low traffic website(s).

We can test using this kind of server. And if need be you can just come back into the backend and move the resource slider to the right to give your application more resources. Maybe try it for awhile and see how it goes.

1GB

1GB RAM, 25GB SSD Disk, 1TB Transfer, 1 Core Processor

for

It says, 1GB RAM, 25GB SSD Disk, 1TB Transfer, 1 Core Processor.

PAY AS YOU GO!

\$0.0139
HOURLY

\$10.00
MONTHLY

You only pay \$10.00 / month which is in line with Commodity Hosting pricing.

Oh don't forget to pick the location closest to you and your customers.

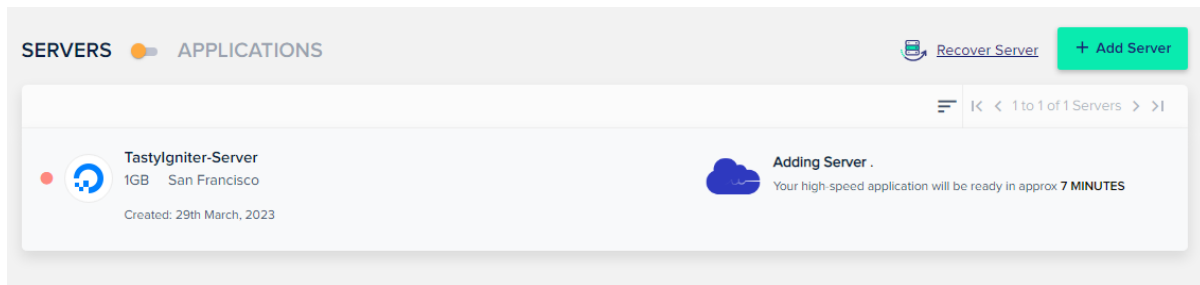

LOCATION

Please select your server location.

London

And then click on "LAUNCH NOW"

LAUNCH NOW

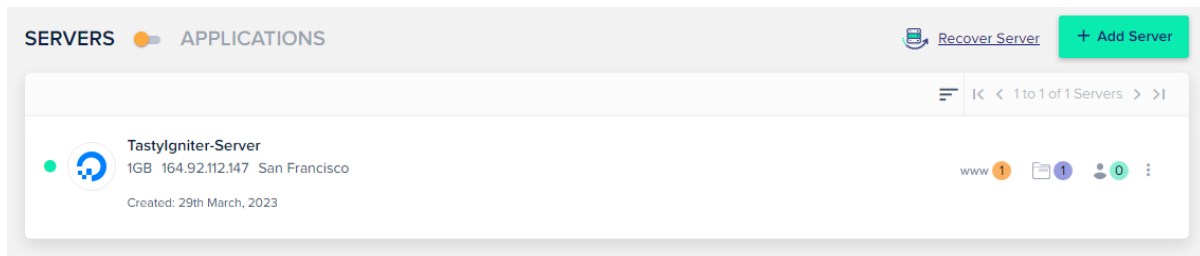

That will be your first server which will house your Tastylgniter application.

Launching your server might not happen right away, but they will tell you about how long it will take.

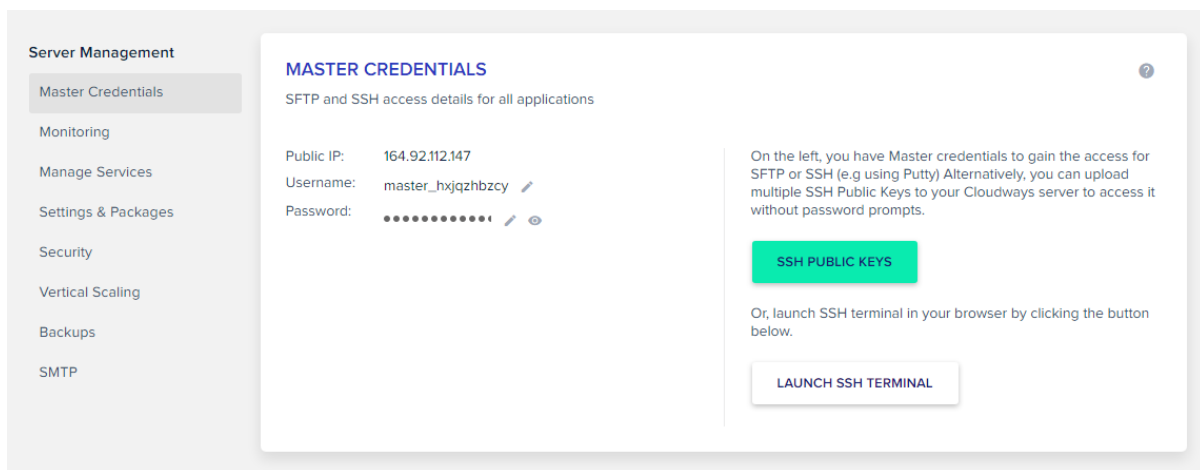

After it is launched you will get this

The next step is to turn off a component for this Server called Varnish. Varnish is a component meant to speed up your website, to reduce the amount of work the server must do, and to increase the amount of available website traffic. It sounds good but it doesn't work with Tastylgniter so we must turn it off.

Do this.

Click somewhere on the wide white rectangle for the server we just got going to bring us to the next page.

Go down to "Manager Services" and click on that.

Server Management

Master Credentials
Monitoring
Manage Services
Settings & Packages
Security
Vertical Scaling
Backups
SMTP

MANAGE SERVICES

Control Core Services that allow your application(s) to run. Changing these settings may break your web app's functioning.

Service	Status	Control
Apache ⓘ	● running	⌛ RESTART
Memcached ⓘ	● running	⌛ RESTART
MySQL ⓘ	● running	⌛ RESTART
New Relic ⓘ	● stopped	✓ ENABLE ⓘ DISABLE
Nginx ⓘ	● running	⌛ RESTART
PHP FPM ⓘ	● running	⌛ RESTART
Varnish ⓘ	● running	🗑 PURGE ⓘ DISABLE

Then from in here look for Varnish. I see it at the bottom.

Varnish ⓘ
● running
🗑 PURGE
ⓘ DISABLE

Click on DISABLE

Varnish ⓘ
● stopped
🗑 PURGE
✓ ENABLE

Now we need to move those 60+ files to your hosting computer. To do this we will use a FTP or File Transfer Protocol program. Popular choices include FileZilla and Cyberduck but there are others.

Go to Master Credentials

Server Management

Master Credentials
Monitoring
Manage Services
Settings & Packages
Security
Vertical Scaling
Backups
SMTP

MASTER CREDENTIALS

SFTP and SSH access details for all applications

Public IP: 164.92.112.147

Username: master_hxjqzhbzczy ⓘ

Password: ●●●●●●●● ⓘ ⓘ

On the left, you have Master credentials to gain the access for SFTP or SSH (e.g using Putty) Alternatively, you can upload multiple SSH Public Keys to your Cloudways server to access it without password prompts.

SSH PUBLIC KEYS

Or, launch SSH terminal in your browser by clicking the button below.

LAUNCH SSH TERMINAL

You can hover the mouse pointer over the Public IP number and then “Click to copy”. Then paste it into your FTP program. You can do the same for Username and Password.

MASTER CREDENTIALS

SFTP and SSH access details for all applications

Public IP:

164.92.112.147

Click to copy

Username:

master_hxjqzhhbzcycy

Password:

.....

Public IP:

164.92.112.147

Copied!

Username:

master_hxjqzhhbzcycy

Password:

.....

Use Port 22

Now login to your hosting account using the FTP credentials that you just copied and pasted over to your FTP program.

Name	Size	Changed	Rights	Owner
 applications		3/29/2023 3:33:35 PM	rwxr-xr-x	root

By using the Master Credentials it won't put you straight into the correct file folder on the hosting computer to place the 60 files into. So we need to navigate over into there.

Click on “applications”

Name	Size	Changed	Rights	Owner
 xpwhuvqrbx		3/29/2023 3:34:07 PM	rwxr-xr-x	root

Click on the next file folder, it will be called something else than what is shown here.

/applications/xpwhuvqrbx/				
Name	Size	Changed	Rights	Owner
 conf		3/29/2023 3:33:44 PM	rwxr-xr-x	root
 logs		3/29/2023 3:33:49 PM	rwxr-xr-x	root

composer.json	2 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
composer.lock	279 KB	10/27/2022 9:20:20 AM	rw-rw-r--	xpwhu...
package.json	1 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
phpunit.xml	2 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
README.md	5 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
vite.config.js	1 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...

Notice that the other two components I mentioned are in here, Artisan and Composer. See they already set some stuff up for you and you don't need to use the Linux command line to do it..

Click on “public”

/applications/xpwhuvqrbx/public_html/public/				
Name	Size	Changed	Rights	Owner
..		3/29/2023 3:34:07 PM	rxrxrxr-x	xpwhu...
favicon.ico	0 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
index.php	2 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...
robots.txt	1 KB	10/17/2022 6:18:45 AM	rw-rw-r--	xpwhu...

Now this should be the file folder on the hosting to upload the TastyIgniter stuff into.

Now navigate to the correct file folder on your desktop computer.

C:\Users\jason\Desktop\TastyIgniter\			
Name	Size	Type	Changed
..		Parent directory	3/29/2023 3:01:54 PM
setup-master		File folder	3/29/2023 3:01:54 PM
setup-master.zip	1,153 KB	Compressed (zipp...	3/28/2023 1:31:53 PM

Go into the “setup-master” folder on your desktop computer.

Name	Size	Type	Changed
		Parent directory	3/29/2023 3:01:54 PM
setup		File folder	3/29/2023 3:01:56 PM
.editorconfig	1 KB	EDITORCONFIG File	3/29/2023 3:01:54 PM
.gitignore	1 KB	GITIGNORE File	3/29/2023 3:01:54 PM

Now we can go find the installer program that is included with those 60+ files we just moved over. It will do the rest of the work for us, more or less. We are getting closer.

From the Cloudways backend go here.

Which is in the “Applications” tab. Find it in the blue navigation bar to the right of the “Servers” tab.

Click somewhere in the white rectangle for the application, I called it “TastyIgniter-App”

That brings you to the ACCESS DETAILS

ACCESS DETAILS

You can read the agreement and then click on "Accept license"

Server Requirements

Check below to make sure all system requirements are met.

PHP Version (required 7.4+)

PDO PHP Extension

cURL PHP Extension

Live Connection

Mbstring PHP Extension

OpenSSL PHP Extension

GD PHP Library

ZipArchive PHP Library

Permission to write to directories and files

System requirements check complete

Your system meets the minimum requirements.

Next Step: Database Settings

It will run a Server Requirements check. Everything looks good so let's continue. Click on "Next Step: Database Settings"

Database Settings

Enter your database connection details.

Hostname

127.0.0.1

Port

3306

Enter the database host name.

Database Name

Enter the name of the database you want to use.

Table Prefix

ti_

The database table prefix. Do not change unless you have to.

Username

Enter the database username.

Password

Enter the database password.

Next Step: Application Setup

[Start Over](#)

As it so happens Cloudways also sets up a database for us so we don't have to do that. This is different than what I have seen in CPANEL where when installing from a script you need to go through the extra steps of creating a database yourself.

So let's go back into the backend of Cloudways.

ACCESS DETAILS

Information related to the several ways you can interact with your application.

APPLICATION URL

phplaravel-972845-3403401.cloud... 

For SSH/SFTP access to your Application. [Read this](#)

Confirm password

Restaurant name
Tastylgniter

Restaurant email
admin@restaurant.com

Attach your Site Carté Key... (Optional)

A Site Carté key is required to add/update item from the Tastylgniter Marketplace. Get one by creating a site from your [Tastylgniter Account](#), if you haven't already.

☐ Enable single location mode

☒ Install demo data

You can change this setting later under the
System General Settings

Next Step: Setup your Site

[Start Over](#)

Let's fill out some fields.

For full name put your name.

Leave Username as "admin"

Make up a good password. It should be something like this

*#cUjd238Kc

and not

My_Password

or

12345

TAKE NOTE OF YOUR PASSWORD or you will not be able to login later and that will be soon enough.

Give your Restaurant a name.

Put in a good email address for yourself.

I'm not going to bother with a site key this time but you may want to do that.

And I'm going to enable single location mode.

Application Setup

Enter your administrator and restaurant details.

Full name Chef Jason	Username admin
Password *****	Confirm password *****
Restaurant name Jason's Pizza Emporium	Restaurant email jasondamischbuilder@gmail.com

Attach your Site Carté Key... (Optional)

A Site Carté key is required to add/update item from the TastyIgniter Marketplace. Get one by creating a site from your [TastyIgniter Account](#), if you haven't already.

☒ Enable single location mode

☒ Install demo data

You can change this setting later under the System General Settings

Next Step: Setup your Site

[Start Over](#)

I am now going to click, "Next Step: Setup your Site"

Setup your site

How do you want to set up your site?

Without any extensions or theme, you can install them later.

Fresh: No theme or extensions

With a pre-built theme and some recommended extensions.

Install with a pre-built theme

I will try it with "Install with a pre-built theme"

Setting up your application... 🍳

Downloading TastyIgniter core...

Looking Good!

Yippee!

That's setup all done.

Are we there yet?

I see this warning.

SECURITY WARNING!

Delete the setup files to stop someone else from overwriting your site, the **setup.php** script and the **setup** directory.

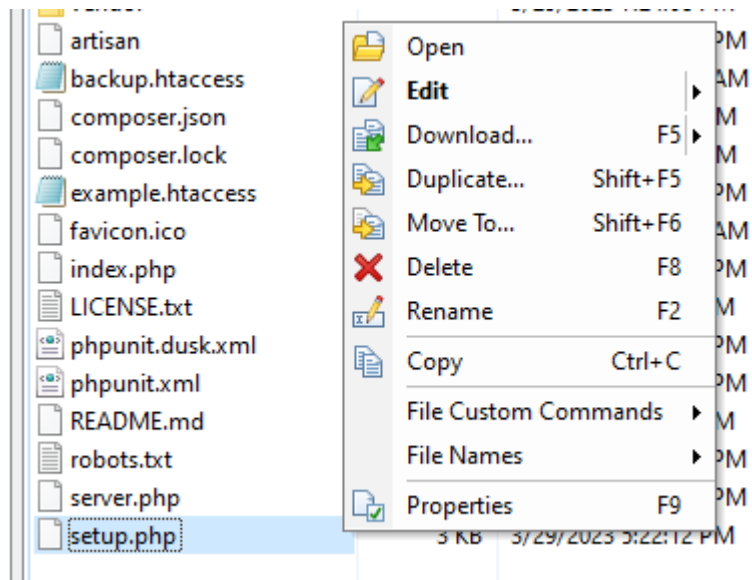

Let's do this.

I go back over to the FTP program. After all of that work the FTP program might have been logged out of the hosting server. So you might need to log back in to continue.

server.php	1 KB	3/14/2023 11:57:08 PM	rw-rw-r--	xpwhuvqrbx
setup.php	3 KB	3/29/2023 5:22:12 PM	rw-rw-r--	master_hxjqzhbzcy

So before we only had those 60+ files in there and a few that it started out with. Now you can see that the installation program has placed many more files and file folders in there. So we need to locate the setup.php file and the setup file folder in all of that.

Be careful not to delete anything else while you are doing this or you might need to start over from scratch. Ouch!

Find setup.php and right click on that one. Then click “Delete”

Do the same for the setup file folder.

Let’s go back over to the TastyIgniter website page.

I will click on, “Next Step: Login to Your Admin Dashboard”

Let's Try!

SUCCESS!

I had fun but what if you made a mistake and you were not able to get this far? Well there is a recourse.

You can totally delete everything and start over. To do so please read the document titled.

REINSTALLING TASTYIGNITER ON CLOUDWAYS

<https://www.jasondamisch.com/restaurant-websites/tastyigniter/Reinstalling-Tastyigniter-on-Cloud-ways.pdf>

I hope that my documents help somebody.

Take Care.
